## Helping Communities Protect Against Cyber Threats

Today, cybersecurity issues represent one of the fastest growing threats to businesses, communities, and government. Often, smaller communities have limited resources and support to effectively monitor cybersecurity issues—and that's where the Public Infrastructure Security Cyber Education System (**PISCES**) can help!

**PISCES** is a nonprofit organization that works with the private sector, colleges/universities, and local governments to provide no-cost cybersecurity monitoring to small communities.

Communities that join **PISCES** not only benefit from the support of cybersecurity analysis—they also are key partners in developing our future cyber analyst workforce. Through **PISCES**, we partner with academic institutions to provide a comprehensive program for students to analyze data for small communities. With our supervised, entry-level cyber analysis curriculum, these students help mitigate identified security threats to bolster your community's cybersecurity while gaining experience to build our future cyber workforce.

### Community Partner Requirements

To qualify as a community partner and receive this no-cost cybersecurity support, you must:

- Be an official public sector organization (e.g., cities, counties, ports, school districts, public utilities)
- Have 150 employees or fewer
- Have a computer to be used for the data collection service
- Agree to participate in data privacy and public sharing limitations.

### Looking For More Details? We've Got Them!

For further details about **PISCES**, please review our program flyer and our FAQ resource for community partners.

### Ready to Partner?

If you are interested in participating in **PISCES**, please contact:
